

Camera to Microscope Eyepiece Adapter

This adapter connects a c-mount camera with a 30 mm eyepiece of a microscope. For connection the eyepiece remains with the microscope. The adapter has an inner diameter of 33 mm. For other diameters custom-made adapters are available. The inlying circular spring guarantees an overall fitting without damaging the eyepiece. Either a black anodised adapter or a plain aluminium adapter is available.

For digital consumer cameras and SLR cameras from Canon, Nikon, Olympus etc. special adapters are available as well. These cameras can be connected to a 23 mm or 30 mm eyepiece. They also include an adapter to connect them to an existing trinocular phototube. The high quality optics and the adjustable length of the adapter distinguish them from other brands. Adjusting the length of the adapter results in a parfocal image when switching from the eyepiece view to the monitor preview screen.

This press release may be published immediately.
